Reflection Questions with Answers

1. Did your estimations reflect the actual effort?

Yes, the story point estimations reasonably reflected the relative effort required for each user story. More complex features, such as managing the reading challenge and tracking reading progress, were assigned higher story points, while simpler tasks received lower estimates. Since this was a simulated sprint, the estimations were based on the expected complexity and effort of the tasks.

2. Was your backlog well-prioritized?

Yes, the backlog was prioritized based on the importance and logical sequence of the features. Core functionalities such as spoiler comment management and personal reading goals were addressed earlier, followed by features such as reading challenge management, progress tracking, chapter discussions, and monthly book voting. This helped create a logical workflow for the sprint.

3. How did your simulated sprint align with your plan?

The simulated sprint closely followed the planned sprint goal. The selected user stories were moved through the appropriate stages of the sprint board, from To Do to In Progress and finally Done. This demonstrated how the planned work could be organized and tracked during a sprint.

4. What insights did the burndown chart give about your team's capacity?

The burndown chart showed the total story points planned for the sprint and the remaining work over time. Since the sprint was simulated and the work items were completed quickly, the chart does not represent a realistic team velocity. However, it demonstrates how a burndown chart can help monitor remaining work and identify whether the team is progressing according to the planned sprint capacity.
