Chat History

User: Fix the broken card comparison in the game.

ChatGPT: The issue is in the card comparison logic. The game is currently comparing the rank names as strings:

```
if guess == "HIGHER":
```

```
    correct = self.next_card.rank_str > self.current_card.rank_str
```

```
else:
```

```
    correct = self.next_card.rank_str < self.current_card.rank_str
```

Change this to compare the numeric ranks instead:

```
if guess == "HIGHER":
```

```
    correct = self.next_card.numeric_rank > self.current_card.numeric_rank
```

```
else:
```

```
    correct = self.next_card.numeric_rank < self.current_card.numeric_rank
```

This makes the cards follow the correct order:

2 < 3 < 4 < 5 < 6 < 7 < 8 < 9 < 10 < J < Q < K < A

This should fix the HIGHER and LOWER prediction logic.

User: Add the consecutive win streak multiplier feature from the README.

ChatGPT: Add a streak variable to the game engine:

```
self.streak = 0
```

Then change the scoring logic so that every consecutive correct prediction increases the streak and adds the streak value to the score.

Use:

```
if correct:
```

```
    self.streak += 1
```

```
self.score += self.streak
```

else:

```
self.streak = 0
```

```
self.score = max(0, self.score - 1)
```

Also display the current streak on the game screen:

```
Streak: {self.streak}
```

Now the first consecutive win gives +1, the second gives +2, the third gives +3, and so on. An incorrect prediction resets the streak to 0.

User: Now add the tie evaluation feature from the README.

ChatGPT: Add a tie check before the HIGHER and LOWER comparison:

```
is_tie = self.next_card.numeric_rank == self.current_card.numeric_rank
```

If the cards have the same rank, display a PUSH message:

if is_tie:

```
self.status_msg = f"PUSH! {self.next_card.rank_str} vs {self.current_card.rank_str}"
```

```
self.status_color = (220, 220, 220)
```

Then keep the normal HIGHER and LOWER comparison inside an elif:

```
elif guess == "HIGHER":
```

```
correct = self.next_card.numeric_rank > self.current_card.numeric_rank
```

else:

```
correct = self.next_card.numeric_rank < self.current_card.numeric_rank
```

The scoring should also only happen when it is not a tie:

if not is_tie:

if correct:

```
self.streak += 1
```

```
self.score += self.streak
```

else:

```
self.streak = 0
```

```
self.score = max(0, self.score - 1)
```

This means a tie is treated as a PUSH, so the score and streak remain unchanged.

User: Add the side-by-side card reveal feature from the README.

ChatGPT: Add a reveal timer to the game engine:

```
self.reveal_end_time = 0
```

When a prediction is made, set the reveal time to about 1.2 seconds:

```
self.reveal_end_time = pygame.time.get_ticks() + 1200
```

During the reveal, keep the new card separate from the current card. Once the reveal time has finished, update the current card:

```
if self.next_card is not None and pygame.time.get_ticks() >= self.reveal_end_time:
```

```
    self.current_card = self.next_card
```

```
    self.next_card = None
```

```
    self.reveal_end_time = 0
```

Also prevent another prediction while the reveal is happening:

```
if self.next_card is not None:
```

```
    return
```

For the rendering, display the current card and the newly drawn card side-by-side with a small gap:

```
reveal_gap = 60
```

This gives the player a short side-by-side view of both cards before the new card becomes the current card.
